

Flash memory

What is flash memory?

Flash memory is a type of non-volatile memory that can be erased and reprogrammed in blocks of memory. It is commonly used in digital cameras, USB drives, and solid-state drives (SSDs). Flash memory is divided into two main types: NAND and NOR. NAND flash is used for high-capacity storage, while NOR flash is used for boot firmware and other applications. Flash memory is also used in mobile devices, such as smartphones and tablets, for storing data and applications. Flash memory is a key component of modern computing and storage systems.
